This is a preliminary, unedited transcript. The statements within³ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

39 Mr. Latta. Well, good morning.

40 I'd like to call the Digital -- the Subcommittee on Digital
41 Commerce and Consumer Protection to order. The chair now
42 recognizes himself for five minutes for an opening statement.

43 And, again, good morning and welcome to the first Disrupter
44 Series hearing in 2018. Today, we are continuing the
45 subcommittee's efforts to examine new and innovative technologies
46 while learning directly from companies about what opportunities
47 they see five to ten years in the future.

48 I'd like to thank all of our witnesses for being with us today
49 and highlight that Owens-Illinois is headquartered in my district
50 in Perrysburg, Ohio and I've been -- we have held two roundtables
51 on IOT and cybersecurity issues with local businesses at your
52 headquarters and I appreciate that.

53 Last summer, this subcommittee hosted a showcase with IOT
54 companies for many of our member districts. We also held a
55 hearing about how the IOT and interconnected network of physical
56 objects embedded with sensors and communication devices that
57 exchange information can improve productivity, increase response
58 times, drive down costs, and benefit consumers.

59 Today, we will discuss how IOT is making American

NEAL R. GROSS

www.nealrgross.com

This is a preliminary, unedited transcript. The statements within⁴ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

60 manufacturing more competitive and how innovation is improving
61 the lives of Americans.

62 We will also learn about barriers to the continued expansion
63 of IOT and what policy makers should keep in mind as the use of
64 IOT expands.

65 The ability of devices to communicate with other devices is
66 revolutionizing industrial practices both in the United States
67 and abroad. Already there are examples of smart components
68 sending data about their performance and condition to workers who
69 can monitor the equipment and if necessary replace it before it
70 breaks down.

71 Municipal water systems embedded with sensors can relay
72 information about blockages or leaks that would help ensure that
73 the water keeps flowing.

74 Another example is how electricity providers can monitor
75 electrical grids embedded with sensors and relays that can
76 identify outages or surges, locate alternative pathways, and
77 ensure that electrons keep flowing.

78 Looking forward, the potential to further -- to further
79 improve manufacturing processes through the combination of new
80 technologies stretches the imagination.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

This is a preliminary, unedited transcript. The statements within⁵ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

81 Utilizing IOT and other emerging technologies like augmented
82 reality, workers will be able to virtually make adjustments to
83 industrial systems to understand how to improve efficiency and
84 then implement necessary changes without interrupting the
85 manufacturing processes.

86 IOT-connected factories will be able to monitor their need
87 for raw materials and then order those materials from
88 IOT-connected warehouses.

89 IOT-connected transportation service providers will then
90 deliver necessary products without the intervention of the human.
91 These and other opportunities allow IOT-connected manufacturing
92 centers the ability to devise their own ways to run more smoothly.

93 Expansion-smart industrial processes will continue to
94 create historic changes in how American companies build and
95 deliver products. More efficient factories means that consumers
96 will have more choices for the goods they purchase while being
97 able to retain them at a lower cost.

98 At the same time, like all new technologies, IOT will create
99 disruption in the manufacturing economy. This disruption will
100 create the need for new ways of educating and preparing our
101 workforce both now and in the future.

This is a preliminary, unedited transcript. The statements within⁶ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

102 In addition, cybersecurity issues remain an ever present
103 concern for an internet-connected service and the IOT is no
104 different. Constant vigilance and improved coordination will be
105 required to ensure that bad actors don't take advantage of the
106 weaknesses in IT security policies.

107 Today, we look forward to our witnesses describing how IOT
108 is being leveraged in their facilities to improve manufacturing
109 processes, how to address concerns around cybersecurity, how this
110 technology is likely to develop in the future, and what
111 policymakers can do to help promote continued innovation in
112 American manufacturing.

113 And with that, I will yield back the balance of my time and
114 now recognize the gentlelady from Illinois, the ranking member
115 of the subcommittee, for five minutes for an opening statement.

116 Ms. Schakowsky. Thank you, Mr. Chairman.

117 The internet of things, of course, has tremendous potential
118 to change manufacturing in the United States. Smart
119 manufacturing can help businesses save resources, improve
120 performance, and expand consumer choice.

121 For example, a senior can remove the need for a human worker
122 to physically check a machine. I didn't mean a senior. I meant

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

This is a preliminary, unedited transcript. The statements within⁷ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

123 a sensor.

124 A sensor can remove the need for a human worker to physical
125 check a machine, assuming everything works correctly. That
126 sensor makes the worker's job easier and reduces the opportunity
127 for human error.

128 As the internet of things evolves, even more and more
129 processes can be automated and this raises some familiar issues
130 for subcommittee -- familiar issues for subcommittee -- privacy,
131 cybersecurity, safety, and labor market impacts.

132 Advanced manufacturing requires a different set of skills
133 than the production line of previous generations and workers must
134 be trained for these jobs, and we need to be responsive to the
135 needs of workers who may be displaced by changes in manufacturing.

136 We must also be mindful of accessibility. I think back to
137 the autonomous vehicle legislation that the House passed last year
138 that this committee worked on. Self-driving cars promise to open
139 up new opportunities to those with disabilities. That's great.

140 But some of those vehicles need to be accessible for people
141 in wheelchairs, for instance, so that we can fully realize the
142 potential to improve mobility.

143 The same goes for manufacturing workers. Depending on how

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

www.nealrgross.com

This is a preliminary, unedited transcript. The statements within⁸ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

144 the technology is designed and integrated, bringing the internet
145 of things into manufacturing could either expand or limit job
146 opportunities for those, for example, with visual impairments or
147 physical disabilities.

148 In addition, we must ensure that businesses can get the full
149 benefit of smart manufacturing. Often, a prerequisite for
150 businesses to integrate new technologies is the broadband to
151 support it.

152 Last year, Democrats on the Energy and Commerce Committee
153 unveiled a comprehensive infrastructure package -- the LIFT
154 America Act, which included a \$40 billion investment in secure
155 and reliable broadband.

156 A serious infrastructure bill takes real dollars and I hope
157 that we can work together to advance that type of job-creating
158 legislation.

159 I would also note that some of the advances we see in the
160 manufacturing stem for research supported by the federal
161 government.

162 For example, President Obama established a national network
163 for manufacturing innovation which included the Digital
164 Manufacturing and Design Innovation Institute in Chicago, which

NEAL R. GROSS

This is a preliminary, unedited transcript. The statements within⁹ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

165 I have visited.

166 The Trump budget eliminates funding for the Manufacturing
167 Institutes. The U.S. can only lead in research if we invest in
168 research.

169 We need a bipartisan deal to raise the budget caps on both
170 the defense and non-defense side so that important investments
171 in infrastructure and innovation can continue.

172 I thank you, and I yield back, unless there is anybody who
173 wants my remaining time. Okay. I yield back.

174 Thank you.

175 Mr. Latta. Thank you very much. The gentlelady yields
176 back.

177 The chairman of the full committee has not arrived yet. But
178 is there anyone on our -- the Republican side -- wishing to claim
179 that time?

180 Not hearing anyone, the chair now recognizes the ranking
181 member of the full committee, the gentleman from New Jersey, for
182 five minutes.

183 Mr. Pallone. Thank you, Mr. Chairman.

184 Since 2015, this subcommittee has been examining the
185 opportunities and challenges of the internet of things, from

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

This is a preliminary, unedited transcript. The statements within¹⁰ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

186 autonomous vehicles to wearable technology.

187 But the internet of things extends beyond consumer products.

188 It can be found across industries including in the energy,
189 healthcare, and transportation sectors, and today we will discuss
190 how it can help make manufacturing more efficient, more
191 productive, and more safe.

192 The internet of things is used in smart manufacturing to make
193 real-time control of production possible. Companies report that
194 using smart manufacturing technologies lowers their energy use,
195 reduces waste, improves product quality, and saves money, and with
196 more efficient manufacturing we see less pollution, fewer health
197 issues for our work force, and more opportunities for good
198 technology-based jobs.

199 As with all connected technologies, strong cybersecurity is
200 essential to successful smart manufacturing. While the internet
201 of things helps ensure that a manufacturer is monitoring,
202 measuring, and sensing control systems work together, one weak
203 point can affect the whole network.

204 Imagine the potential consequences if a malicious actor
205 brought down automated manufacturing at a pharmaceutical plant
206 that makes vaccines or if network disruptions affect the quality

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

www.nealrgross.com

This is a preliminary, unedited transcript. The statements within¹¹ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

207 control monitoring for seatbelts at an auto plant.

208 Experts have found that companies in the U.S. are not doing
209 enough to address these risks and that a strong comprehensive
210 framework for cybersecurity in manufacturing is urgently needed.

211 And also, unlike our smart phones, which seem to be replaced
212 every few years, large machinery is used for decades, adding to
213 the difficulty of ensuring they are consistently and properly
214 updated for security vulnerabilities.

215 And I have said at previous hearings on automation that we
216 should not be scared of these new technologies but we must realize
217 their potential effect on jobs.

218 To stay competitive, we must ensure that employers are
219 prepared for the changing workplace and we need to invest more
220 in research and development so that the U.S. continues to lead
221 the world in innovation.

222 For years, we have listened to experienced witnesses in
223 industry, academia, and government tell us that federal
224 investment is vital if you want to keep making things in America.

225 Unfortunately, the Trump administration proposed a budget
226 last year that eliminates dozens of essential successful programs
227 that make manufacturing innovation possible and provides support

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

228 for U.S. factory workers.

229 Moreover, industry witnesses repeatedly tell us what they
230 really need is stability. Yet, Republicans have repeatedly
231 failed to pass final appropriation bills for the fiscal year that
232 began on October 1st and we are once again at a deadline tomorrow.
233 It appears that Republicans are going to try once again to kick
234 the can down the road.

235 And with this delay, Republicans are adding even more
236 instability, ultimately hurting American manufacturers and
237 workers. I think those delays must end, but we will see.

238 And I would like to yield the remainder of my time to the
239 gentlewoman from California.

240 Ms. Matsui. Thank you, Ranking Member Pallone.

241 The internet of things and the industrial internet of things
242 represents a shift in how companies and manufacturers interact
243 with data.

244 Smart manufacturing enables real-time monitoring and
245 tracking of a company's assets through the manufacturing process.
246 New technologies and tools can be critical to the means of
247 facilitating the efficiencies promised by Industry 4.0.

248 Of course, connectivity is a cornerstone of the next

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

This is a preliminary, unedited transcript. The statements within¹³ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

249 industrial revolution and wireless connectivity depends on the
250 availability of spectrum.

251 I believe that technologies like block chain could play an
252 interesting role in both spectrum sharing to potentially maximize
253 efficient use of spectrum bands and as a means of tracking digital
254 records in real time.

255 Thank you, and I look forward to the witnesses, and I yield
256 back.

257 Mr. Pallone. And I yield back, Mr. Chairman.

258 Mr. Latta. Thank you very much. The gentleman yields back
259 the balance of this time. This concludes member opening
260 statements.

261 The chair reminds members that, pursuant to committee rules,
262 all members' opening statements will be made part of the record.

263 Again, I want to thank all of our witnesses for being with
264 us today. We take -- we appreciate you taking time to testify
265 before us and it's very important to hear from you and your
266 testimony.

267 Today's witnesses will have the opportunity to give
268 five-minute opening statements followed by a round of questions
269 from the members.

This is a preliminary, unedited transcript. The statements within¹⁴ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

270 Our witness panel for today's hearing will include Mr. Rodney
271 Masney, the vice president of technology and service delivery
272 information of technology at Owens-Illinois; Mr. Thomas
273 Bianculli, chief technology officer at Zebra Technologies
274 Corporation; Dr. Thomas R. Kurfess, professor and HUSCO/Ramirez
275 distinguished chair in fluid power and motion control at the
276 George W. Woodruff School of Mechanical Engineering at Georgia
277 Institute of Technology; and Mr. Sanjay Poonen, the chief
278 operating officer at VMWare.

279 So we really appreciate you all being with us today and, Mr.
280 Masney, you are recognized for your opening statement for five
281 minutes.

282 Thanks again for being with us.

This is a preliminary, unedited transcript. The statements within¹⁵ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

283 STATEMENTS OF RODNEY MASNEY, VICE PRESIDENT, TECHNOLOGY SERVICE
284 DELIVERY, INFORMATION TECHNOLOGY, OWENS-ILLINOIS; THOMAS D.
285 BIANCULLI, CHIEF TECHNOLOGY OFFICER, ZEBRA TECHNOLOGIES
286 CORPORATION; DR. THOMAS R. KURFESS, PROFESSOR AND CHAIR IN FLUID
287 POWER AND MOTION CONTROL, GEORGE W. WOODRUFF SCHOOL OF MECHANICAL
288 ENGINEERING, GEORGIA INSTITUTE OF TECHNOLOGY; SANJAY POONEN,
289 CHIEF OPERATING OFFICER, VMWARE

290

291 STATEMENT OF MR. MASNEY

292 Mr. Masney. Good morning to the members of the committee
293 and to my colleagues who have travelled to Washington today to
294 discuss the importance of the internet of things.

295 Before I begin, I would like to thank Congressman Latta for
296 his continued leadership and engagement on the issue. I also want
297 to thank the committee for the opportunity to discuss IOT, which
298 is important to U.S. manufacturing and my company specifically.

299 Owens-Illinois, headquartered in Perrysburg, Ohio, is the
300 world's largest manufacturer of glass containers, serving
301 globally recognized brands throughout the world.

302 Our company operates 79 manufacturing plants throughout the
303 world, 17 of which are located in the United States. Glass making

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

This is a preliminary, unedited transcript. The statements within¹⁶ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

304 has historically been a trade where craftsmen -- crafts persons
305 and apprentices would develop expertise in the art of glass
306 making.

307 At the turn of the century, Michael Owens invented automated
308 glass manufacturing, which was a huge step change in productivity
309 and worker safety.

310 While the glass making process is highly automated today,
311 the industry is poised for the next step change, which will come
312 from the factory becoming increasingly connected with IOT
313 technologies throughout the end-to-end process.

314 The information collected through IOT technology will be
315 used to transform the craft of glass making to that of data-driven
316 science which will enhance the competitive position of glass in
317 the global packaging industry.

318 Glass containers are the most sustainable option in the
319 competitive packaging landscape with a life cycle that goes from
320 cradle to cradle, reusable in many markets and infinitely
321 recyclable into either new glass containers or other products.

322 Glass is truly the sustainable packaging option.
323 Owens-Illinois is on an IOT journey, which will transform our
324 manufacturing process and add value to the products and services

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

This is a preliminary, unedited transcript. The statements within¹⁷ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

325 that we sell our customers.

326 There are several IOT areas of focus for OI. Improve
327 manufacturing performance through higher yields, increase
328 quality, and reduce costs. IOT will deliver deeper insights into
329 our end-to-end manufacturing process.

330 The data generated from sensors in the plant will provide
331 insights into environmental conditions, process settings, and
332 control variances, enhancing our ability to increase first-time
333 yields and improve quality.

334 This work will require skilled engineers, information
335 technology professionals, and data scientists. The data
336 required through IOT will be used to reduce reaction time in the
337 plants and allow us to adjust the process if controls are slipping
338 out of tolerance.

339 Addressing the variations in manufacturing process will be
340 realized in a more proactive manner. The IOT platform will
341 transform glass making -- the glass manufacturing process from
342 one of reactivity to one that is proactive and highly automated.

343 The information generated by new sensor technology, data
344 science, and information automation will increase yields and
345 improve quality while achieving reduced costs and enhancing OI's

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

www.nealrgross.com

This is a preliminary, unedited transcript. The statements within¹⁸ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

346 ability to compete in the U.S. and global markets.

347 Energy management and predictive maintenance are the second
348 area of IOT development OI is pursuing. It takes a great deal
349 of energy to melt and form glass and to operate a glass container
350 manufacturing facility.

351 Developing sensor technology can help glass containers
352 maintain the status of the most sustainable packaging solution
353 and reduce energy used to operate our furnaces.

354 Advanced sensor technologies can also be used to collect
355 information while monitoring equipment throughout the
356 manufacturing facility and could be critical to seeking new ways
357 to maintain equipment.

358 IOT technologies and the concepts around IOT is enabling OI
359 to also create and develop new and differentiated products and
360 services for our customers with the goal to ensure the integrity,
361 safety, and authenticity of its contents.

362 I would like to highlight the several concerns regarding
363 successful deployment and sustainability of IOT. Because the
364 achievable deployment of IOT throughout an enterprise can be quite
365 daunting, a successful deployment of IOT requires sensors, PLCs,
366 IT systems, networking, massive amounts of storage and software

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

This is a preliminary, unedited transcript. The statements within¹⁹ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

367 to achieve the desired business outcomes.

368 Seeking ways to make these investments more affordable can
369 be a way to help U.S. manufacturing accelerate its investments
370 in IOT technologies.

371 Protecting against cybersecurity risks will become more
372 critical while manufacturers deploy IOT in facilities.
373 Manufacturing equipment devices, sensors, and control systems
374 that previously may have been standalone, maybe exposed, not just
375 within a plant location but also potentially throughout an
376 enterprise.

377 Cybersecurity-related disruptions could cause unplanned
378 down time or impair productivity. Cybersecurity attacks could
379 also put health and safety of employees at risk.

380 Data scientists are in short supply and high demand.
381 Transformation of the workforce becomes more critical.
382 Tomorrow's manufacturing workforce must be increasingly
383 knowledgeable about the use of information technology.
384 Engineering disciplines and information technology skills will
385 be needed to deliver and sustain these solutions.

386 The use of business intelligence analytics and the role of
387 data scientists will be critical to success of IOT.

388 In conclusion, as manufacturers continue on the IOT journey,
389 Congress may want to look at ways -- into the following ways to
390 help foster growth of IOT technology and its use, assist
391 manufacturers and making IOT technologies more affordable by
392 encouraging research and investment in these capabilities or in
393 programs which encourage manufacturing companies to deploy IOT
394 or programs and resources that address cybersecurity in U.S.
395 businesses and encourage more research in the IOT data science
396 discipline and seek ways to encourage a supporting pipeline of
397 skilled workers through universities and manufacturing and
398 related technicals -- technical schools.

399 Thank you for your time and attention.

400 [The prepared statement of Mr. Masney follows:]

406 STATEMENT OF MR. BIANCULLI

407

408 Mr. Bianculli. Thank you, Chairman Latta, Ranking Member
409 Schakowsky, and members of the subcommittee for the opportunity
410 to testify before you today.

411 I am Thomas Bianculli, the chief technology officer of Zebra
412 Technologies Corporation, and we are a global leader in bringing
413 internet of things solutions to business-to-business and
414 business-to-government markets.

415 With approximately \$3.7 billion in revenue, nearly 7,000
416 employees, and doing business in more than 40 countries, Zebra
417 is a trusted partner to more than 95 percent of all Fortune 500
418 companies.

419 And while many Americans may not know us by name, I am sure
420 they come into contact with our solutions every day. For example,
421 the bar code labels that are printed and applied to airline baggage
422 tags or express delivery packages and pharmaceutical prescription
423 bottles are often generated by a Zebra bar code label printer and
424 tracked and managed by Zebra bar code scanning technology and
425 mobile computers.

426 Similarly, manufacturing, warehouse, and delivery workers

427 as well as countless healthcare workers across the globe employ
428 our mobile computing devices in their daily work to increase
429 efficiency, reduce errors, and drive a better customer
430 experience.

431 Overall, what we see in the marketplace every day tells us
432 that manufacturers and their supply chain partners are
433 increasingly recognizing the transformational role of industrial
434 IOT.

435 Solutions in driving growth and improving performance in
436 several key areas of business activity including increased total
437 production and through put, improved ability to adjust to
438 fluctuating market demand, and increased ability to produce a
439 greater number of product variance, and increased visibility into
440 operations across a given business enterprise, and a decreasing
441 cost of production.

442 All of these advances reflect the fact that, at its heart,
443 the IOT revolution is a dramatic change in advancement in the way
444 companies capture and ultimately share data.

445 The ability to have data about inventory that's immediately
446 available to both plant floor managers and suppliers is providing
447 new levels of visibility that heightens operational performance

NEAL R. GROSS

448 and from -- and from the greater visibility comes the great
449 advances we are seeing in manufacturing across a wide array of
450 industries.

451 In the opening comments from Chairman Latta, I heard mention
452 of augmented reality and wearable technology. I think we should
453 really keep that in mind as we see industrial internet of things
454 creating more and more data. There is the opportunity to collect
455 that data, analyze that data, and then use that information to
456 inform a worker.

457 And as we are starting to see that occur, we are seeing that
458 mobile and computing technologies migrate from an interface that
459 is handheld to interfaces that become heads up and are able to
460 augment our physical reality with digital information that helps
461 U.S. citizens and U.S. workers just get the job done.

462 And I think that's an incredible opportunity for competitive
463 advantage for us to help drive efficiency and to lead the world
464 by way of example in that regard.

465 Whirlpool Corporation wanted to optimize mobile device
466 management at its distribution centers as a way of enhancing
467 productivity. They were experiencing problems with misplaced
468 devices, battery life, the inability to update devices in a

NEAL R. GROSS

469 systemic way, and a lack of data metrics around device
470 performance. It needed a centralized management system to track
471 device health, productivity, location, and ensure proper
472 deployment.

473 To solve their problem, Zebra worked with Whirlpool to employ
474 an IIOT-based solution which uses our mobile computers connected
475 to their vehicle-mount computers and our handheld devices.

476 We connected all of their devices back to the cloud across
477 all of their facilities. We are able to manage the predictably
478 detect when batteries may need replacing, when the performance
479 and health of applications on the device, the resiliency and
480 security of the network, and by monitoring all that information
481 in near real time we can detect and proactively intercede if we
482 see that a device is going to have a problem, thereby driving up
483 the overall worker efficiency and uptime of their operations.

484 Congress can play an important role in helping to ensure that
485 all companies across America can successfully employ industrial
486 IOT-based solutions.

487 Specifically, we urge you and your colleagues to support
488 infrastructure legislation that promotes the deployment of mobile
489 broadband networks as well as directs the NTIA and FCC to allocate

NEAL R. GROSS

490 more commercial licensed and unlicensed spectrum in a
491 technology-neutral way.

492 Additionally, we urge Congress to advance policies that will
493 help assure coordination among government agencies so that
494 regulation of IOT does not needlessly impede innovation.

495 In sum, Mr. Chairman, we commend the subcommittee for holding
496 this hearing, for your ongoing efforts to ensure that American
497 industry has the ability to continue to roll out new technologies
498 that will improve the lives of both our workers and our citizens.

499 IOT presents a transformative opportunity, some calling it
500 the fourth industrial revolution, the advent of cyber physical
501 systems that will create all types and sizes across -- of
502 opportunity for jobs of all types and sizes across the United
503 States to work smarter, be more productive, and help improve the
504 overall American economy.

505 At Zebra, we are committed to bringing IOT solutions to
506 companies to help them achieve their goals. We look forward to
507 continuing to work with the subcommittee and I thank you for the
508 opportunity to share a Zebra story, and I am happy to answer any
509 questions you and your colleagues may have.

510 Thank you.

517 STATEMENT OF MR. KURFESS

518

519 Mr. Kurfess. Thank you, Chairman Latta, Vice Chairman
520 Kinzinger, Ranking Member Schakowsky, and other members of the
521 committee.

522 I do appreciate the opportunity to testify here before the
523 subcommittee. So I am Tom Kurfess. I am at Georgia Tech. The
524 difference between my colleagues here and myself is our product
525 or our students.

526 For example, mechanical engineering produces about 3% to 4%
527 of all the mechanical engineers in the nation and these kids are
528 extremely capable and really moving a lot of the IOT forward.

529 I have spent a lot of time in manufacturing. I grew up
530 actually in a plant in Congresswoman Schakowsky's district. I
531 went to high school there and so forth -- a small family plant.
532 So I've been in production for over 40 years.

533 And if you look at it, you know, we talk about the fact that,
534 yes, it's going to take a lot of money to sensor up, as we would
535 say it. But there are already a lot of sensors out there and
536 they're providing free information, you know, to us and so forth.

537 So there are a lot of sensors. They're generating big data.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

538 The companies know this and we are starting to track this. My
539 team works with two major U.S. OEMs in automotive, a major OEM
540 in aerospace and several large-scale suppliers to figure out what
541 their digital manufacturing platforms need to look like.

542 And, basically, all the data are there for the taking and
543 how are we going to make use of them, right. And then the question
544 is what can we do with it.

545 Well, certainly, we can improve efficiency. I think we've
546 heard about that. We could lower our energy consumption. We can
547 lower our waste.

548 You know, this is very clear. It's been demonstrated time
549 and time again. I've spent a lot of time actually over at the
550 BMW plant in South Carolina -- tremendous opportunities there in
551 terms of moving it forward.

552 A safer work place -- certainly, the more sensors you have
553 out there, you know what's going on. You can make sure that your
554 employees are safe and you can make sure that those machines keep
555 them safe and actually make their jobs easier and more reliable.

556 But perhaps a very important point that we need to really
557 understand is that this capability allows us to respond rapidly
558 to the changing markets and the changing technologies that are

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

This is a preliminary, unedited transcript. The statements within³¹ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

559 out there, and those technologies and markets are changing
560 rapidly.

561 It took about 70 years for the telephone to become
562 ubiquitous. It took about 10 years for the mobile phone to become
563 ubiquitous. It took about a year for the smart phone to become
564 ubiquitous. This is how fast things are changing.

565 So we can have a safer place, a place that responds better,
566 and what industry doesn't want to respond better and faster?

567 What do we get out of the internet of things for
568 manufacturing? First of all, there are better paying jobs.
569 There's no doubt about it. But I will caution you, and I will
570 say this again, it requires a much lower-skilled workforce and
571 a better trained workforce.

572 But it's not impossible to do. I think we just saw over here,
573 and I will wave mine around too, people are used to the smart phone.
574 This is not something that they're afraid of. We can get them
575 to use it and actually we are using smart phones in production
576 operations day in and day out at a number of different
577 corporations.

578 We get a stronger more productive manufacturing base, which
579 is always good for the nation's economy and national security,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

This is a preliminary, unedited transcript. The statements within³² may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

580 and we basically excel in the strengths of the culture of the
581 United States of America.

582 We are innovative, right. We have some of the best ideas
583 and what this technology allow us to do, IOT for MFG, as we call
584 it, it allows us to get these ideas out there rapidly and not just
585 out there but to scale them in terms of the market.

586 And you know, if somebody else wants to copy us, come get
587 us, because by the time you copy us, you know, we'll have our next
588 technologies out there and we can see how fast these things are
589 moving along.

590 So how do we get there? Basically, we have to look at
591 workforce development. I heard cybersecurity a number of times.
592 This is critical. You know, people -- and we've actually seen
593 at companies where they say, no, we are going to not do this because
594 of cybersecurity issues.

595 They have now come to the realization that we have to do this
596 if you're going to compete, and we are looking at cybersecurity.
597 We have a lot of, for example, national apps.

598 NIST is doing some great work in cybersecurity analysis and
599 so forth in conjunction with our universities and a variety of
600 companies.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

This is a preliminary, unedited transcript. The statements within³³ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

601 So it's there. We are thinking about it. We are working
602 on it and we are beating the bad guys in most cases. We have to
603 develop that infrastructure to make sure that that broadband
604 connectivity -- I heard that, right -- that is so important.

605 Again, the low-cost labor areas, yes, you see their shiny
606 new factories but a lot of low-cost labor areas don't have that
607 type of connectivity. We can leverage that. We could make use
608 of that. That is where we can compete.

609 We also need to take a look at our universities. Right. How
610 do we leverage our universities? How do we leverage our national
611 labs -- places like NIST and bring them together? I heard the
612 National Network for Manufacturing Innovation, Manufacturing
613 USA. This is where companies are coming together to really move
614 things forward for the United States of America and this is where
615 we can really leverage these things.

616 So, basically, this is going to allow us to rapidly address³³
617 a changing market, not just what people want but what the
618 technology is when it comes out there.

619 The bottom line is IOT for manufacturing it's going to grow.
620 It's going to grow high in jobs. But that basically means not
621 just workforce development and workforce training, not training

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

This is a preliminary, unedited transcript. The statements within³⁴ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

622 the next generation workforce but training the current generation
623 workforce. It can be done. We can't compete on the low-end jobs.
624 We just can't, right. But we can compete on the high-end jobs
625 and people are not afraid of the technology. It is amazing. You
626 know, we are doing Pokemon out in the factories right now and
627 they're tracking things, and they love it, okay, and their reward
628 might be to get off a couple of hours early on a Friday afternoon.

629 But it allows to grow the national economy, to grow key
630 sectors of the national economy -- high-tech sectors -- to
631 strengthen our national security, to make sure that we are able
632 to move forward in a rapid a nimble way.

633 Thank you very much.

634 [The prepared statement of Mr. Kurfess follows:]

635

636 *****INSERT 3*****

This is a preliminary, unedited transcript. The statements within³⁵ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

637 Mr. Latta. Again, thank you for your testimony.

638 And Mr. Poonen, you are recognized for five minutes for your
639 opening statement. Am I pronouncing your name correctly, sir?

640 Thank you.

This is a preliminary, unedited transcript. The statements within³⁶ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

641 STATEMENT OF MR. POONEN

642

643 Mr. Poonen. Dear Chairman Latta, Ranking Member
644 Schakowsky, members of the subcommittee, and my honored
645 colleagues from academia and the industry, it's an honor to be
646 here to testify in front of this committee.

647 And by way of instruction, my name is Sanjay Poonen. I am
648 chief operating officer of VMWare. VMWare is one of the top five
649 software companies in the world, about a \$54 billion market cap
650 company.

651 We are headquartered in the Silicon Valley in Palo Alto. We
652 are also part of the Dell Technologies family.

653 It's very clear from a lot of what you have heard already
654 that the internet of things and IOT has a profound impact on the
655 consumer economy and also in the industrial age.

656 I will just give you two examples of how our lives have
657 changed. One is from my past job. I worked for a German software
658 company, SAP, and many of the meetings that I had would actually
659 be at 1:00 p.m. in the afternoon, German time, which is 5:00 a.m.
660 Pacific time. So mean scheduled, I go down to my home office and
661 I find out that overnight some person had the great joy of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

www.nealrgross.com

This is a preliminary, unedited transcript. The statements within³⁷ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

662 cancelling the meeting.

663 Now, listen, wouldn't it have been nice if I could have known
664 that before I went to bed and I could have probably woken up an
665 extra hour later.

666 Well, it would be nice if once the meeting is cancelled it
667 actually communicated with my alarm clock that actually set my
668 clock up an hour later, which is very much possible today with
669 IOT because often the alarm clock and your calendar is on the same
670 device.

671 Another example -- when I leave to go to ski -- not a lot
672 of snow this year in Tahoe but the years that we do have snow,
673 we'll have a debate with my wife as to whether we turn the heating
674 off.

675 And I like to keep the energy down and keep the house not
676 necessarily heated all the time. She wants to keep the house warm
677 for our kids when we come back home.

678 Well, now with modern thermostats you can actually turn your
679 thermostat on or off from your phone when you get about an hour
680 closer to NIST and many others are doing this.

681 So this is the practical way in which our consumer lives are
682 being transformed for the better with IOT and this is now starting

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

This is a preliminary, unedited transcript. The statements within³⁸ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

683 to invade the American worker.

684 And manufacturing actually becomes enormously smart, as you
685 heard, because of this and it has profound impact, we believe,
686 in lots of new areas -- artificial intelligence, big data machine
687 learning that can be very positive as opposed to as much as what's
688 also been talked about, the negative impacts.

689 But it does have some profound security challenges and that's
690 been a key part to VMWare's focus. VMWare's focus is to ensure
691 that the cyber attacks that we've seen, whether it's WannaCry,
692 Petya, many of these things that could get even more profoundly,
693 you know, disruptive in the context of IOT is something that we
694 can attack and we can protect ourselves from.

695 So we've actually been focused on aspects of cybersecurity
696 and cyber hygiene that allow companies to protect themselves in
697 this era of IOT.

698 We've got some very practical ways in which management
699 security would be baked into the infrastructure of both technology
700 and manufacturing.

701 We think that everybody today, whether you're in technology
702 or not in technology, need to be educated in some very fundamental
703 principles of security, like, for example, least privilege, micro

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

www.nealrgross.com

This is a preliminary, unedited transcript. The statements within³⁹ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

704 segmentation, multi factor authentication and identity
705 management, encryption, patching.

706 These are all very fundamental concepts that board members
707 today are being educated on and certainly government and other
708 professionals need to.

709 As we think about the notion of hardware, that's also getting
710 more sophisticated. We heard about mobile devices and rugged
711 devices -- one of my colleagues.

712 Edge gateways now are becoming ways by which this miniature
713 data center could actually become micro into something like a
714 little nano data center, protected and ready for the production
715 line.

716 These are the ways in which we believe that the internet of
717 things and smart manufacturing can actually be secure.

718 In closing, the internet of things will have a significant
719 and positive impact, we believe, on both American innovation and
720 jobs.

721 Billions of IOT devices will be in the free market for
722 consumers, will be available to manufacturing and can have a very
723 positive impact.

724 But to make sure that this is actually deployed in a safe

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

www.nealrgross.com

This is a preliminary, unedited transcript. The statements within⁴⁰ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

725 fashion, security is key. If consumers are to trust these devices
726 and manufacturers were to trust these devices, we've got to take
727 security seriously and we believe that this is something that both
728 the coming together of academia, of industry and the government
729 makes this a priority.

730 We look forward to working and doing our part at VMWare to
731 make this happen.

732 The other aspect of this that could be very positive is the
733 way and which the data can actually help a whole new category of
734 jobs, whether it's machine learning, big data, artificial
735 intelligence.

736 This is going to be the next color of jobs, and much the same
737 within the agrarian culture. A hundred years ago we couldn't see
738 the coming of computing and high tech the same way the next 50
739 to 100 years are going to be very exciting in terms of new jobs.

740 Chairman Latta, Ranking Member Schakowsky, I applaud the
741 leadership of this committee for holding this hearing today.
742 Thank you for the opportunity to testify and I look forward to
743 answering the committee's questions.

744 [The prepared statement of Mr. Poonen follows:]

745

This is a preliminary, unedited transcript. The statements within⁴¹ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

746

*****INSERT 4*****

This is a preliminary, unedited transcript. The statements within⁴² may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

747 Mr. Latta. Well, again, thank you all for being with us
748 today. We really appreciate your testimony before the
749 subcommittee.

750 And now we'll move into our question and answer portion of
751 the hearing, and I will recognize myself for five minutes.

752 Mr. Masney, what are the major advantages for OI that come
753 from using IOT? And, again, when I've been through the facility
754 in Perrysburg where you do a lot of the testing and seen a lot
755 of what you're implementing there. But if you could maybe just
756 walk us through what you're doing.

757 Mr. Masney. Certainly. Some of the advantages are
758 increased productivity in our manufacturing facilities. As I
759 said in my statement, glass is still somewhat art, and we need
760 to transform to data-driven science manufacturing process where
761 we can increase our yield.

762 Manufacturing -- glass manufacturing yield is somewhere in
763 the 90 to 91 percent yield rate. If we are able to do that, we
764 are able to unlock potential and capacity out of our factories
765 and better serve the markets and, ultimately, reduce our cost to
766 our customers.

767 Mr. Latta. What are some of the challenges that you're

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

WASHINGTON, D.C. 20005-3701

This is a preliminary, unedited transcript. The statements within⁴³ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

768 facing out there today in the home manufacturing process then?

769 Mr. Masney. And having enough of knowledge base in a
770 workforce that has a demographic that is changing. The
771 degeneration of knowing what to do, when to do it, is changing
772 in our organization, and being able to empower people with
773 information so that they can react faster and more nimbly is
774 incredibly important. And cyber security -- that is a concern
775 today because many of our machines and equipment stand alone. So
776 they're not -- they're not exposed to cyber attack. And as we
777 network them and collect more and more information to better
778 empower our workforce it's going to be incredibly important that
779 we protect the floor, our people, and the company.

780 Mr. Latta. Thank you very much.

781 Mr. Bianculli, can you give us an example of how a sensor
782 can be used to convert data from a format that allows companies
783 to improve manufacturing efficiency?

784 Mr. Bianculli. Sure. We -- I think a couple of examples
785 there -- one is just driving operational efficiency. I mentioned
786 the Whirlpool example earlier, where we just have a stream of data
787 coming from devices.

788 Well, just like we've done that with Whirlpool on device

NEAL R. GROSS

This is a preliminary, unedited transcript. The statements within⁴⁴ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

789 health, we are looking at doing that with the entire manufacturing
790 facility.

791 So imagine, if you will, a smart manufacturing environment.
792 We know where goods are. We know where the capital assets are
793 in that environment. We can know where people are located and
794 we can bring the intersection of all those things together in an
795 optimized way.

796 We think about our daily lives using a route navigation GPS
797 system in our vehicles. The incredible amount of advantage --
798 the ability to dynamically reroute based on whether in traffic
799 in real time and think about going from outside the four walls
800 to an inside the four walls factory environment and being able
801 to bring that same level of route optimization, work flow
802 efficiency, dynamic work flow optimization to the processes by
803 instrumenting the environment.

804 I think that as we look at data coming from these environments
805 we are moving towards a world where we no longer operate on what
806 we think is happening -- where do I think my people are, where
807 do I think my assets are, where do I think inventory is -- we are
808 operating in a world where we truly know that in real time.

809 And so we are able to close this gap between what we think

This is a preliminary, unedited transcript. The statements within⁴⁵ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

810 is happening and what we would ideally like to be happening and
811 that is where the benefit is -- the efficiency benefit. The
812 return on investment is being able to close that gap. And so you
813 can run your operations in a much more precision way and in a way
814 that's optimized from the get-go.

815 We are seeing the need -- the imperative to do that because
816 of the on-demand economy. The notion that products and services
817 are being delivered ever closer to the point of demand is a
818 reality. We order online and the expectation is that product or
819 good or service is delivered sometimes in an hour to our doorstep
820 if it's a package that we ordered online and we live in an urban
821 city, or in some cases I am standing at a street corner and I
822 request a ride and in moments I expect that to show up.

823 So the production and provisioning of products and services
824 ever closer to the point of demand dictates, mandates, it's an
825 imperative that we have IOT solutions that are able to create
826 real-time streams of data to enable that new reality to propel
827 us forward.

828 Thank you.

829 Mr. Latta. Thank you.

830 Mr. Poonen, I guess in my last 40 seconds -- this is going

NEAL R. GROSS

This is a preliminary, unedited transcript. The statements within⁴⁶ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

831 to be quick -- this deals with how to manufacturers manage the
832 threat of cyber attack disrupting their operations?

833 Mr. Poonen. Okay. Good.

834 Yes, I think one of the things that we have learned, Chairman,
835 sir, is that in this world of mobile, this device is not sort of
836 a remote control to your life.

837 We've learned a lot about security in the last 10 years with
838 the mobile device. These operating systems have adapted
839 themselves from the PC era to have even greater level of security,
840 whether it's Apple iPhones or Android devices. Some of the
841 security things that you heard -- so you saw in the early days
842 of Windows. And even the PC operating systems, latest version
843 of Windows 10 are better at being able to --

844 We respect that same innovation, and this country has got
845 some of the best research, whether it's from academia or other
846 places. We'll continually pour it into the operating systems
847 that run on these IOT devices. That's one, and we expect that
848 to just have a greater and greater level of enterprise hardening.

849 Secondly, the devices and the systems that they talk to,
850 whether it's the data center or the cloud, will have the types
851 of things that I talked about -- cyber security, security

NEAL R. GROSS

This is a preliminary, unedited transcript. The statements within⁴⁷ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

852 infrastructure baked into it that have the types of things like
853 segmentation, multi factor authentication, encryption. And we
854 are learning from all of the attacks that have happened to make
855 those also systems hardened.

856 And then the third and final thing is just basic hygiene,
857 and sort of just like you have a good diet, you do your exercise,
858 you still got to have certain hygiene principles -- brushing your
859 teeth, taking a shower, things of those kinds.

860 We've got to educate, you know, government, industry,
861 academia, college students, so that as they approach the workforce
862 there's simple things you probably want to do.

863 You may not want to send your password, for example, in clear
864 text on a text message. These are the types of things that --
865 and you may want to change your password -- these are the types
866 of things that I think are very easy for us to continue to educate
867 that make us all a much more secure society and a secure
868 infrastructure for IOT.

869 Mr. Latta. Thank you very much.

870 And the chair recognizes the gentlelady from Illinois, the
871 ranking member of the subcommittee, for five minutes.

872 Ms. Schakowsky. Thank you.

This is a preliminary, unedited transcript. The statements within⁴⁸ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

873 First, Owens-Illinois -- are you still in Illinois at all?

874 Mr. Masney. Yes, we are. We are in Streeter, Illinois.

875 Ms. Schakowsky. Okay. Glad to hear that, being from the
876 Chicago area.

877 I think I, years ago, saw the plant. Were you over in Granite
878 City, down in southern Illinois?

879 No. Okay. Let me ask Dr. Kurfess some questions.

880 How do workers in manufacturing stand to benefit from the
881 adoption of these technologies? Can the IOT be used to, for
882 example, positive things -- prevent workplace injuries, limit
883 workers' exposure to hazardous materials, et cetera? And what
884 are some of the pluses of IOT for workers?

885 Mr. Kurfess. Sure. It's a great question.

886 You know, there are a variety of -- you know, there are a
887 variety of things that could be going on, for example, worker going
888 through the factory.

889 If you have been, for example, to an automotive factory you
890 see the robots going on. They're moving, they're working. These
891 are carrying sometimes in the thousands of pounds. So they're
892 very powerful robots. And you'd never let a human get close to
893 them.

NEAL R. GROSS

This is a preliminary, unedited transcript. The statements within⁴⁹ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

894 But now you have the robot area. You have the human area,
895 and the reality is now with IOT of things, you know, and again,
896 one has to be careful about, you know, this issue of privacy and
897 so forth.

898 But I am even walking down with my phone. I know where people
899 are. So if somebody walks into, you know, an incorrect area, you
900 know, we can shut it down and make sure the roadblock, you know,
901 doesn't hurt them.

902 But even better, we can start to localize it better -- a much
903 tighter resolution such that the robots can be working with the
904 people.

905 You know, robots are great. But they're never going to
906 replace people completely. I mean, they're great at lifting
907 really heavy things but try and pick up an egg with one and so
908 forth.

909 We have great research on that. But, you know, again,
910 working together is really where you leverage it and, by the way,
911 it also allows us to get rid of a lot of the really nasty jobs.

912 You're saving about -- you know, taking away the sort of the
913 terrible jobs, checking cooling tanks and lubrication tanks and
914 machines. That's all automated.

NEAL R. GROSS

This is a preliminary, unedited transcript. The statements within⁵⁰ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

915 In fact, this morning I was down in your cafeteria and I
916 saw your coffee containers -- the coffee urns. They have the same
917 technology that we are using now in there. You know, it's about
918 50 cents and so the only difference is ours are online and so
919 they're reporting the information. But we are talking with
920 companies like Chik-fil-A and McDonald's about, you know, how to
921 do that for, your know, improving their efficiency.

922 So these are the types of things we see out there.

923 Ms. Schakowsky. Well, I am also very interested in keeping
924 manufacturing jobs in the United States and bring them back, and
925 you wrote in your testimony that America's infrastructure gives
926 us an advantage there. I would like to hear more about that.

927 Mr. Kurfess. Sure. Well, if you look at everything from
928 our roads to broadband and so forth, and again, these are things
929 that people really use all the time. Whether it's broadband or
930 you're wired into your factory or broadband, you know, over here,
931 that capability and that growing of that capability allows us to
932 take the big data generated by all of these different sensors,
933 and in some instances, again, it's not just well, I've have a bunch
934 of sensors, but in some instances we have -- I've got this phone
935 with this really nice camera and we have, you know, our -- we have

NEAL R. GROSS

936 our workforce taking a picture.

937 So now we are combining, right, the workforce who says oh,
938 this is good -- this is bad -- taking the picture. That brings
939 it together -- integrates the information together. But you have
940 got to get that out streaming all of the data and it is a lot of
941 data.

942 And then, of course, the other infrastructure of these, the
943 educational infrastructure. You know, if you think about the
944 technology from even five or ten years ago, it's old. So we've
945 got to keep that work force spun up. Lifelong learning and that
946 infrastructure needs to be put into place so that, you know,
947 today's worker is still viable in five or 10 years.

948 Ms. Schakowsky. Well, I was going to ask about that because
949 you -- the role of government and, certainly, public education
950 is a part of that, but there's also federally funded research,
951 et cetera.

952 So government does have a role to play then, doesn't it?

953 Mr. Kurfess. Oh, definitely. And all the way -- again, you
954 know, from the K through 12 that we hear about education and so
955 forth to our Bachelors students or Masters and Ph.D.s, I mean,
956 if you take a look at National Science Foundation, I was sponsored

NEAL R. GROSS

957 at MIT, right, as a National Science Foundation on a project there.
958 A good chunk of our graduates, Master's and Ph.D.s in engineering,
959 technology, and in science are supported by the National Science
960 Foundation.

961 You know, again, that's something that you don't really see
962 but they're supported as research assistants and this is a very
963 important thing to move forward, you know, the entire
964 infrastructure for the nation.

965 Ms. Schakowsky. I appreciate that.

966 So I am concerned because spending plans that we've seen from
967 Republicans make drastic cuts to many of these things and to
968 programs that directly support manufacturing and innovation,
969 including President Obama's Manufacturing USA initiative.

970 So these cuts, I am assuming, then could be a barrier to
971 progress?

972 Mr. Kurfess. Yes. I think that what you have to look at,
973 right, is in the short term it's fairly easy to make a cut like
974 this and so forth.

975 But really, the federal government -- we don't have AT&T Bell
976 Labs anymore. We don't have really long-range thinking
977 companies. You know, they're focusing on the here now, and I

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

978 don't blame them, right.

979 The federal government has to step in there and really do
980 some of the longer range thinking. I guarantee you, China's doing
981 it. Germany's doing it. You name it, other countries are doing
982 it. We need to do it.

983 So in five years, in 10 years, we are positioned to continue
984 to move forward. This is really, again, what we really need to
985 be looking at a little bit longer term and that's what these R&D
986 capabilities are all about that we are talking about.

987 Ms. Schakowsky. I appreciate that, and I yield back, Mr.
988 Chairman.

989 Mr. Kurfess. Thank you.

990 Mr. Latta. Thank you very much. The gentle lady yields
991 back.

992 The chair now recognizes the gentleman from Illinois, the
993 vice chair of the subcommittee, for five minutes.

994 Mr. Kinzinger. Thank you, Mr. Chairman.

995 And just to go off with what you were saying, sir, I agree
996 with you. I think there's a role for the government in terms of
997 long-term strategic planning that sometimes get lost in, you know,
998 the kind of momentary debates which is, you know, as we look at

NEAL R. GROSS

999 world that changes, whether it's with IOT, whether as we look at
1000 autonomous vehicles, which this committee deals with and all that
1001 kind of stuff, we have to have people that are thinking long range
1002 and beginning to prepare our workforce for what that future looks
1003 like.

1004 It doesn't mean the heavy hand of government but it also means
1005 let's consolidate some of these programs we have and try to
1006 incorporate a vision which some of our competitors,
1007 unfortunately, do all too well.

1008 I want to thank the chairman for yielding and I want to thank
1009 you call for being here. I am excited. I have two companies
1010 represented here that have a strong presence in Illinois -- Zebra
1011 and Owens-Illinois.

1012 Zebra is based in Lincolnshire, Illinois, which, you know,
1013 now that the economy is expanding maybe you can build one in my
1014 district too because there's no -- there's no presence there yet.
1015 But we'll take it in Illinois.

1016 And Owens-Illinois, of course, does have a strong presence
1017 in Illinois. Somehow they're headquartered in Mr. Latta's state
1018 but we can talk about that, too.

1019 And as Mr. Masney said, there's an OI facility right in

NEAL R. GROSS

1020 Streeter, Illinois, and in my district. So proud to have you
1021 there. You provide good-paying jobs. I was able to visit a few
1022 years ago and have been very impressed by what I've seen.

1023 I would like to ask the panel, talking about the development
1024 of IOT, does that mean that American workers will require new
1025 training and what are companies doing to obtain a skilled
1026 workforce?

1027 I would like one or two of you to answer that with your
1028 perspectives.

1029 Mr. Bianculli. Sure. So yes, absolutely, happy to have our
1030 presence in Lincolnshire and we should talk later.

1031 Mr. Kinzinger. Yes.

1032 Mr. Bianculli. So yes, with regard to that, worker training
1033 -- I think the future we are talking about here isn't going to
1034 arrive evenly, right.

1035 We are going to see certain areas. We are already seeing
1036 IOT drive location technology being used to control drones in site
1037 facilities to be able to -- in manufacturing plants, actually,
1038 to be able to detect inventory in a more automated fashion.

1039 The ability to have robots deployed in a distribution or
1040 fulfillment center -- but what's happening in those environments

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.

(202) 234-4433

www.nealrgross.com

This is a preliminary, unedited transcript. The statements within⁵⁶ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1041 today is -- let me take the robot example where goods now are
1042 bringing -- taken to the picker. If you have a human, at the end
1043 of the day, is doing that picking for those online orders to fulfil
1044 those orders, and the goods are being brought to them instead of
1045 them walking to the goods.

1046 And what does that mean? There's no job taken away.
1047 There's just several less miles a day that that worker is going
1048 to walk. That means there's many more picks per hour that worker
1049 can do.

1050 And so we are in a world now and will be for some time where
1051 humans and machines and automation, whether it be physical
1052 automation or it be artificial intelligence augmenting the
1053 worker, basically, a digital assistant --

1054 Mr. Kinzinger. And I just want to add onto that.

1055 If you look at the example, for instance, around Europe, the
1056 Germans are very good at manufacturing. They have a very low
1057 unemployment rate. But they are also embracing this kind of
1058 future technology.

1059 So we don't have to be scared of the future because it's
1060 coming. We just have to figure out how to lead and innovate in
1061 that process.

This is a preliminary, unedited transcript. The statements within⁵⁷ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1062 Let me -- I will go on. Mr. Poonen, when you talk about the
1063 internet of things, does that create new concerns when it comes
1064 to intellectual property?

1065 For instance, does the data collected in IOT manufacturing
1066 reveal anything proprietary that companies might want to protect?

1067 Mr. Poonen. Yes, sir.

1068 I think that one of the things you have to first remember
1069 is that the first wave of IOTs being able to take away mundane
1070 tasks and make them something that could actually be done more
1071 autonomously, I will give a very simple example.

1072 You don't want to watch me parallel park a car. I am terrible
1073 at it. That's a perfect job for a machine to do better than a
1074 human because it's a combination of cameras and geometry, and
1075 it'll probably parallel park better than you.

1076 But my value add long term isn't parallel parking. So what
1077 we want to be able to do as the next wave of economy shows up is
1078 to ensure that you have got the appropriate privacy and security
1079 baked into many of the machines. And there's a whole dedicated
1080 work of security being focused on the devices and what's on there
1081 and we have to make sure that there's standards also because the
1082 same type of privacy that applies to peoples home, people are

1083 worried as to whether or Alexa or Siri is always listening to you.
1084 Those are the types of things that standards need to be applied
1085 both from the government and industry working together, and I
1086 believe that this is absolutely solvable in the same way that the
1087 industry and government work together on standards like common
1088 criteria.

1089 This will be applied to the new world of IOT in the coming
1090 years, we believe.

1091 Mr. Kinzinger. And Mr. Masney, what's the trend when it
1092 comes to the cost of deploying IOT? Can you envision a day when
1093 the entire manufacturing process, from the procurement of raw
1094 materials to the delivery of the finished project, is 100 percent
1095 automated without human intervention?

1096 Mr. Masney. No, I can't envision a day like that. It still
1097 takes human beings on the manufacturing floor to make things
1098 happen and make sure things are moving forward.

1099 I will share with you, in Streeter, Illinois it is one of
1100 our facilities where we will be -- we are delivering what we call
1101 the factory of the future for the organization and invite you to
1102 come see that at some time that make sense.

1103 But, certainly, we are still going to need the capability

1104 to have people on the floor that can run machines, be ever present,
1105 make sure things are running safely, that productivity continues
1106 to move forward.

1107 Our innovations are around more flexibility and making sure
1108 that we can be more responsive to our customer base. And IOT is
1109 another area where we think -- we think we can do that as well.

1110 Mr. Kinzinger. Thank you all for being here, and I yield
1111 back.

1112 Mr. Latta. The gentleman yields back, and the chair now
1113 recognizes the gentlelady from California for five minutes.

1114 Ms. Matsui. Thank you very much, Mr. Chairman. I want to
1115 thank the witness panel. This is absolutely fascinating to know
1116 what's going on now and what the possibilities are too in the
1117 future.

1118 Digitally connected supply chains have the potential to be
1119 an important component of the industrial internet of things.
1120 Just in time, manufacturing promises to drive down the need for
1121 storing excess inventory and allow suppliers to anticipate and
1122 deliver the materials manufacturers will need more quickly.

1123 Decentralized ledger technologies like block train can make
1124 supply chain transactions faster and cheaper by securely

1125 connecting manufacturers and suppliers in real time.

1126 I would like to hear from Mr. Poonen and Mr. Kurfess what
1127 are your thoughts on technology such as block chain and others
1128 and its ability to play a role in IIOT manufacturing and security.

1129 Mr. Kurfess. Sure. So that's a -- it's a great set of
1130 questions and the reality is the distributed capability, whether
1131 it's block chain, you know, or any of these other distributed
1132 capabilities.

1133 These are going to be critical in terms of moving things
1134 forward. You know, if I've got a supplier, you know, only one
1135 supplier that supplies me with parts, and if I say tomorrow, oh,
1136 I need -- you know, I was at Toyota -- how is it going there, this
1137 was in Kentucky, and they said, well, great, you know -- you know,
1138 we've got, you know, very, you know, every six hours we can get,
1139 you know, parts from Denso and so forth -- we are very lean. We
1140 have, you know, very small inventory. You go to Denso -- how is
1141 that working for you? Well, we've got, you know, two or three
1142 months of supply back there because we don't know what they're
1143 going to -- you know, what they're going to ask us.

1144 Now, they're starting to figure out how they're going to ask
1145 together. But imagine if instead of one big company, Denso,

NEAL R. GROSS

1146 right, we had a bunch of smaller companies, right, that could
1147 supply this.

1148 So, yeah, if I need 500 parts, right, as opposed to having
1149 one company say can you make 500 parts, I could go to, you know,
1150 a hundred companies, local companies, mom and pop shops, and say,
1151 I need five parts, or how many can you supply -- five, ten.

1152 And all of a sudden you can -- you can bring that together.
1153 You not only can get those parts there -- and by the way, you could
1154 use something like an Uber to make a delivery, right. You know,
1155 but and so the infrastructure -- again, back to the
1156 infrastructure, it's there to pull it off, right.

1157 But now you also have a very resilient supply chain. If one
1158 goes down, you don't have to worry about it.

1159 Turning that around as well on the educational side, you can
1160 take at what are these guys doing and, you know, where do they
1161 need more training and let's get them that training.

1162 We could even percolate that down into our colleges and into
1163 our high school levels so we can deliver the education to the
1164 workforce and we can even start to send the right students in the
1165 right direction to really engage them.

1166 So lots of stuff. Distributed, you know, all the way from

NEAL R. GROSS

1167 supply chain -- supply chain of parts but supply chain of our
1168 workforce as well. Thank you.

1169 Ms. Matsui. That's great. Thank you.

1170 Mr. Poonen.

1171 Mr. Poonen. Yes. I think, Congresswoman, this is a very
1172 important topic. There's a lot of speculation and euphoria right
1173 now about Bitcoin and block chain.

1174 I think the bigger story is the fact that this notion of a
1175 subledger, which is really what block chain about --

1176 Ms. Matsui. Yes.

1177 Mr. Poonen. -- really transforms the way in which you do
1178 commerce at a much more miniature level and if you think about
1179 IOT it's sort of a miniaturization of this type of device.

1180 Now, you take -- combine that with commerce now becoming even
1181 more miniature, it has profound implications that could be
1182 enormously positive, and that's really, we think, the big story.

1183 If there are ways by which manufacturing could get smarter
1184 and even potentially more secure, and the commerce that happens
1185 -- electronic data interchange -- all of this would become a lot
1186 more efficient and potentially also secure because it's now
1187 distributed as opposed to one choke point -- distributed actions

NEAL R. GROSS

www.nealrgross.com

This is a preliminary, unedited transcript. The statements within⁶³ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1188 have lots of inherent ways in which you can actually make the
1189 system a lot more secure.

1190 At the same time, it does require us to take security and
1191 privacy even more importantly because of this distributed nature,
1192 and that's something we are beginning to do early research on,
1193 not just from industry perspective but also in academia.

1194 But I am confident that the positive aspects, if you take
1195 away the speculative aspects of block chain, the positive aspects
1196 will have a profound implication that's actually -- and we need
1197 to, as a country, be at the forefront of the research. If we don't
1198 do it, some of the other countries in the world are.

1199 Ms. Matsui. Oh, good. Well, I thank you very much.

1200 That was very interesting. Let me go on to something
1201 quickly. The Clean Energy Smart Manufacturing Innovation
1202 Institute in California has been working to accelerate smart
1203 manufacturing throughout the country.

1204 Broad collaboration on integrated tools and systems that are
1205 driving smart manufacturing will help reduce the cost of deploying
1206 these technologies.

1207 These partnerships and collaborations can also facilitate
1208 the interoperability of devices and standards.

This is a preliminary, unedited transcript. The statements within⁶⁴ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1209 Mr. Kurfess, how can government and industry partnerships
1210 help develop tools and practices that will drive smart
1211 manufacturing adoption.

1212 Mr. Kurfess. That's a great question.

1213 You know, I think we've already heard about things like --

1214 Ms. Matsui. Yes. Go ahead.

1215 Mr. Kurfess. Oh, I am sorry. Have heard about things like
1216 standards and so forth. But, really, to help move this forward.

1217 You know, the difficulty is, again, you get back to the
1218 distribution. You know, different people want different, you
1219 know, standards and different capabilities and so forth.

1220 When you start to bring these entities together so, you know,
1221 the smart manufacturing team that's, I think, centered in the Los
1222 Angeles area, they're actually -- and it's not only the big
1223 companies but it's also the so-called small and medium sized
1224 enterprises -- the SMEs -- that they're bringing together. So
1225 they're really bringing everybody together to say yeah, how does
1226 this move forward -- how do we do this.

1227 And what a lot of companies are getting is, yes, I need to
1228 release this, because to become more productive, more capable,
1229 right, I need to participate in this standard.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1230 It's like when I turn my -- you know, when I turn my laptop
1231 on, the wifi, I know I am going to be online. That's a standard
1232 and that's really where we need to be going with manufacturing.

1233 And by the way, we need to do it -- we see our, you know,
1234 competition overseas doing it in a big way. So, you know, we got
1235 to be cognizant of that.

1236 Thank you.

1237 Ms. Matsui. Well, thank you. This is all very interesting.

1238 I know I ran out of time but thank you.

1239 Yield back.

1240 Mr. Latta. Thank you very much. The gentlelady yields
1241 back.

1242 The chair now recognizes the gentleman from Kentucky for five
1243 minutes.

1244 Mr. Guthrie. Thank you very much. I appreciate this. My
1245 background, before I got here, was in manufacturing, and it wasn't
1246 very long ago that somebody from Ford Motor Company would make
1247 an order from a supplier -- my family was a supplier -- you would
1248 have a production meeting where they'd say, "We need a thousand
1249 of these parts."

1250 A guy would walk out to the plant to look around and with

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

www.nealrgross.com

This is a preliminary, unedited transcript. The statements within⁶⁶ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1251 the clipboard -- or lady -- and say, "Okay, we got this much here,
1252 this much there. Let's go to the shipping dock. See how much
1253 we have there," because you couldn't always depend on the counts.
1254 So then they would call the buyer at our place and say, "I need
1255 X amount." So they would walk out on the floor and say, "How many
1256 do I have?" and with the clipboard and it would -- it would --
1257 this whole string of things.

1258 And if you go to an assembly plant and invite anybody from
1259 Bowling Green, Kentucky to go the Corvette plant and see one of
1260 America's great cars made, well, what you look for is how
1261 phenomenal all of this stuff just comes together and how much
1262 effort and time and planning.

1263 So if you do it now, you get a production manager who says,
1264 "I need a thousand parts," somebody uploads it on the internet,
1265 the supplier comes in the morning, downloads it, everything is
1266 bar coded -- I assume Zebra -- but everything is bar coded so you
1267 can depend on the counts, and all of a sudden it makes a work order.
1268 When you ship it you bar code it. When it goes out it creates
1269 a purchase order so you get paid for it and that's distributed
1270 through the internet or through the transfers -- not necessarily
1271 through checks like you used to have to open checks and move

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

This is a preliminary, unedited transcript. The statements within⁶⁷ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1272 forward.

1273 And that's happened in the last -- since I've been in
1274 manufacturing. It wasn't that long ago I started. And it's just
1275 a phenomenal look forward.

1276 But I wasn't thinking -- I was looking at Mr. Poonen's
1277 testimony and looking at Dr. Kurfess' here, my son went to Georgia
1278 Tech so we appreciate having you here today.

1279 But I was looking at this security and cybersecurity, because
1280 we think about data security and whether your credit card was
1281 secure. You had all these retailers come in and talk about --
1282 really, if you put everything online and everything is internet
1283 of things in your manufacturing facility, is there a cyber attack,
1284 could that shut down an assembly plant.

1285 So in your testimony you talked about the importance of
1286 systems like internet of things, gateways, and why -- you talk
1287 about securing the production lines, and not necessarily, I don't
1288 think, it's just from attack you were talking about. But just
1289 if you could throw that in as well and the importance of cyber
1290 hygiene and can you describe how this would provide a reasonable
1291 level of security?

1292 Mr. Poonen. Happy to, and I think the focus on security is

This is a preliminary, unedited transcript. The statements within⁶⁸ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1293 a very good one, and I think just the same way that if you thought
1294 about various different eras of computing, sir -- mainframe, the
1295 client server, to mobile cloud -- this notion of security has
1296 become a more and more profound because if there's one thing
1297 that's true, even though security is getting a lot of spending
1298 in software the bad guys -- there's more attacks than there's
1299 actually investment even in security companies.

1300 So we have got to take this seriously, and the good news is
1301 that countries like the United States and Israel have been on the
1302 forefront of security spending. We want to take that serious.

1303 So the way in which we think about IOT is as these devices
1304 get miniature, first off, you want to make sure the operating
1305 system that's on those devices are as secure as possible and I
1306 think we've learned a lot as the new operating systems that are
1307 post-PC have gotten more mature and with every generation they're
1308 getting better and better. IOS is a good example of that and the
1309 iPhone being more secure than the first examples of the PC and
1310 those will play down to the miniature devices.

1311 Secondly, you want to have control points that dislocate just
1312 these devices into what's called a gateway. So gateway is just
1313 a consolidated form of many of these so that you have one place

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

This is a preliminary, unedited transcript. The statements within⁶⁹ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1314 rather than multiple places where much of it gets consolidated.
1315 Dell manufacturers some of those gateways. You got to make sure
1316 those are secure.

1317 And then as they talk to other systems, for example, a data
1318 center or a cloud, that connection needs to be secure, and there's
1319 techniques like micro segmentation, ways in which you
1320 authenticate into those systems using multi factor
1321 authentication.

1322 These are all technical terms but for the folks who are savvy
1323 in security we are educating more and more of them.

1324 And then, finally, for the common person, as I described
1325 earlier, you want to be able to educate them on some very basic
1326 principles of cyber hygiene, especially as it relates to their
1327 access of systems.

1328 Having a two-factor authentication is something that
1329 everybody should know about. It's not just your user name but
1330 some other factor. Maybe it's your birth date. Maybe it's your
1331 mother's maiden name. And setting up your system so that you have
1332 that and are refreshing. That allows less possibilities that
1333 your consumer accounts will get hacked the same way that the
1334 enterprise is dealing with it.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1335 These are just a few of the many principles of cyber security
1336 written in the white paper about this and it's a topic that both
1337 -- all of us in the industry -- there shouldn't be competing
1338 agendas here. We need to work together to make sure the security
1339 of the IOT systems.

1340 Mr. Guthrie. A quick question. I appreciate Mr. Masney.
1341 He was talking about glass and going from 91 to 93 percent. I
1342 am aluminum foundry die casting and as you said it's sometimes
1343 more of a art than science, and I remember saying that in a meeting
1344 and a guy goes, "Well, all scientists were art at one time and
1345 how do you perfect it?"

1346 So I only have a few seconds. But I just -- when these first
1347 come out a whole industry is created and everybody is buying these.
1348 All of a sudden you get saturation and sustainable and
1349 improvement. But there's a whole world of people in Silicon
1350 Valley, all over America, to go in and redo these plants, redo
1351 these facilities.

1352 And I don't have much time left, but anybody want to talk
1353 about just what transformation and what economy that could create
1354 by people going through and refurbishing their plants?

1355 Mr. Kurfess. I will just really quickly fire it off because

This is a preliminary, unedited transcript. The statements within⁷¹ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1356 we see it across the board. We work with a lot of different
1357 companies.

1358 You know, the opportunity is tremendous. You know, whether
1359 the small or the medium or the large companies because, again,
1360 you know, the kids now they program these things, you know, and
1361 so they're in there, hey, look at -- we can do this. Bar code
1362 readers -- oh, you don't need -- I mean, this is the bar code
1363 readers now and so forth. And so they're really implementing it.
1364 And so is it does allow you to, you know, to do these types of
1365 implementations.

1366 But back to Mr. Poonen's point, you know, we've got to make
1367 sure that we are very secure about this. So, you know, and again,
1368 in our classes whether it's high school or junior college,
1369 whatever, you know, we now see that a lot of this type of thing,
1370 we are just doing good hygiene. For example, do not plug this
1371 into, you know, just any old computer. I go to a machine shop.
1372 Million-dollar machine tool recharging my phone, which could have
1373 a virus on it.

1374 And so these are the types of things that we really have to
1375 start teaching them and stuff. But the opportunity is
1376 tremendous.

This is a preliminary, unedited transcript. The statements within⁷² may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1377 Mr. Guthrie. Thank you. Thank you for indulging us.

1378 Mr. Bianculli. Representative Guthrie, one other point, if
1379 I may.

1380 There's a whole suite of capabilities I was starting to bring
1381 to these enterprise devices. We actually called it mobility DNA.
1382 But the idea is taking a standard operating system that we might
1383 be using Android by way of example and layering a whole host of
1384 enterprise-centric security on top.

1385 So and we are working closely actually with VMWare on this
1386 sort of thing. So as these devices -- these internet end points
1387 are deployed in these manufacturing facilities, being able to make
1388 it secure all the way up the device level, so we have a network
1389 of secure devices instead of just trying to secure the network,
1390 and that's an investment we are making to basically serve
1391 enterprise in a more secure way than we might find in traditional
1392 consumer devices.

1393 That, and the last thing -- another word silos. I think
1394 there's tremendous opportunity to bring silos down across what
1395 many of my colleague here spoke about -- from farm to fork, if
1396 you will.

1397 So for being able to share data from, you know, where that

NEAL R. GROSS

1398 seed was planted in the farm field and be able to carry that data
1399 all the way through to optimize the harvest out to the
1400 transportation carriers for just-in-time delivery and then
1401 ultimately getting to a retail location where we can all enjoy
1402 that in a much more efficient way and in a way that allows us to,
1403 in a more cost effective way, to reach more people.

1404 So I think the data silo opportunity is tremendous as we start
1405 to collect more and more data across all the different elements
1406 of the supply chain.

1407 Thank you.

1408 Mr. Guthrie. Thank you very much. I appreciate the
1409 indulgence.

1410 Mr. Latta. Thank you.

1411 The gentleman from Pennsylvania is recognized for five
1412 minutes.

1413 Mr. Costello. Thank you, Mr. Chair.

1414 Dr. Kurfess, I wanted to focus on something that you had
1415 provided in your written testimony, not just ask you but ask the
1416 rest of the panel for their feedback as well.

1417 There's no doubt IOT in manufacturing will help to grow our
1418 manufacturing operations and will generate new and higher-paying

1419 jobs.

1420 However, those jobs will be filled by individuals that are
1421 highly trained. Furthermore, those individuals will need to be
1422 continuously trained and that's what I want to focus on.

1423 In the latest and state-of-the-art technologies to keep
1424 U.S. manufacturing operations at the forefront of this rapidly
1425 advancing technology wave, thus, a culture of lifelong learning
1426 must be instilled and supported in our workforce.

1427 If you look at our high schools and STEM schools and trade
1428 schools for 18 to 19 year olds, I am struck by the opportunities
1429 that might be available to incorporate more of this lifelong
1430 learning culture into curriculum at an earlier age so that it is
1431 not incumbent upon a company in order to do that.

1432 And when you look at company of 20, 30 people, even startups
1433 of two or three individuals, it's just simply not sustainable to
1434 offer that type of learning and sort of up-to-date type education
1435 that's required in order to keep a well-trained workforce.

1436 I've already spoken too long. Share with me what you think
1437 the right kind of learning platforms are in order for our country
1438 to be a leader for the next 20 and 30 years so that these are not
1439 jobs that are not remaining in the U.S.

1440 Mr. Kurfess. Sure. So really quickly, you know, the first
1441 thing is, I mean, I can tell you, we have turbine blade production.
1442 We do a lot of work in turbine blade production. So we have
1443 turbine blade production machines. We are doing research and so
1444 forth.

1445 And typically you need about 15, 20 years of experience
1446 before we turn you loose on those in, you know, production
1447 operations.

1448 We have developed gaming interfaces -- high-performance
1449 computing that can really -- you know, it just pounds that problem
1450 to dust and there are gaming interfaces and we have high school
1451 kids who are now programming, you know, these types of machines
1452 and so forth.

1453 So it's a whole different way of learning and as I mentioned
1454 before, we can even take a look at, you know, who is, you know,
1455 really excelling.

1456 People think, oh, engineering -- I've got to be a super
1457 genius. Well, you have to be fairly good at math and so forth.

1458 But if we can start to really identify those students early
1459 on and start to work them forward -- they don't necessarily have
1460 to go in to engineering. Maybe they're going to go into the shops

1461 and so forth and get the right type of training.

1462 But it's a two-way street. So the infrastructure is coming
1463 into place. We have a number of these different -- you know, if
1464 again you look at Manufacturing USA, these centers that are
1465 working with the local and particularly the community colleges,
1466 the Associates degrees and so forth, we are -- they are saying,
1467 yes, what is the next generation that we need to be moving forward
1468 and let's work that into the curriculum.

1469 And that's not only for the two-year degrees but for the
1470 continuous learning. And then we also see a lot of the
1471 professional societies, that they have a lot of curriculum
1472 development that's deployable whether it's on the web or
1473 interactive and so forth.

1474 So a lot of the technology is moving out. But I agree, you
1475 have got to build it in. Universities, I think, have done a good
1476 job with life long learning. We now have to start to propagate
1477 that down into the K through 12. It's getting there, but once
1478 it's there, I think the access for those students and for that
1479 work force is available and it also does respond very quickly to
1480 the needs of the workforce and the needs of the market.

1481 Mr. Costello. Right. Mr. Poonen.

This is a preliminary, unedited transcript. The statements within⁷⁷ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1482 Mr. Poonen. I would just briefly add, this topic is
1483 personally very much a topic of passion for me, sir.

1484 I came to this country as an immigrant. I am now a U.S.
1485 citizen, partly because the United States has the best
1486 universities. I studied my computer science at Dartmouth
1487 College. I did my MBA at Harvard University at Harvard Business
1488 School, and I hope that this continues to be the country with the
1489 best education in the world.

1490 The education has now changed. Today, my kids, who live in
1491 Los Altos, California, are learning through Khan Academy.
1492 YouTube has completely transformed education and it's not just
1493 for kids.

1494 You can get a how-to or learn-to anywhere anyplace in 15-,
1495 20-minute Ted Talk types of videos and we encourage our workers
1496 to constantly be in that learning mode and the good news is the
1497 internet makes that possible.

1498 And it's almost like, you know, upending the classroom where
1499 learning is happening at home in the evenings and the classroom
1500 becomes a discussion form. That's the new fashion of what we're
1501 doing.

1502 I think the other part that is incumbent on all of us as

NEAL R. GROSS

This is a preliminary, unedited transcript. The statements within⁷⁸ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1503 leaders is to mentor others. As much has been given to us, we've
1504 got to give back to the next generation. I encourage all of us
1505 -- I know many of our colleagues here do the same -- it's our job
1506 to mentor the next generation. As we do that, both the
1507 combination of STEM and mentoring will make the next generation
1508 ready.

1509 Mr. Costello. That's interesting. So it might be
1510 technology that enables us to teach technology.

1511 Mr. Poonen. Exactly, sir. That's what we hope.

1512 Mr. Costello. Anyone else?

1513 Mr. Masney. From a manufacturing company perspective, we
1514 are investing in our local high schools and STEM programs to help
1515 the younger generation get interested in science and technology.

1516 We are also working with local universities to make sure
1517 there's an interest as well. So, you know, I personally believe
1518 helping workers, obviously, continuous learning -- lifelong
1519 learning -- there's also an aspect of company helping our
1520 employees be lifetime employable through those kinds of ideas as
1521 well.

1522 Mr. Costello. I appreciate your feedback. I yield back.

1523 Mr. Latta. Gentleman yields back.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

This is a preliminary, unedited transcript. The statements within⁷⁹ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1524 The gentleman from South Carolina is recognized for five
1525 minutes.

1526 Mr. Duncan. Thank you, Mr. Chairman.

1527 Siri, hey Siri. I use that as an example in that these
1528 devices are always listening, right. Whether you have an Echo
1529 in your home or some similar device, whether manufacturing has
1530 those devices that, as you say, are all interconnected, or whether
1531 you as an individual have a smart TV and internet rumors, true
1532 or not, that that TV is spying on you and sharing that information.

1533 As we move forward with technology and we have a refrigerator
1534 that notices that my milk is low and asks me if I want to order
1535 milk, and I do, sends a signal to the grocery store -- milk, bread,
1536 other things I may need delivered to my home by a autonomous
1537 vehicle, right.

1538 So I consider myself a conservative. There's nobody in this
1539 room that would say I am not a conservative. But I would actually
1540 take it another step further. I am a conservatarian in that I
1541 have a libertarian streak in me that it's my information and I
1542 own it. But in this scenario that I laid out, who actually
1543 controls that data and who owns that data, and at some point, it's
1544 the government getting that data and what do they do with it.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

This is a preliminary, unedited transcript. The statements within⁸⁰ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1545 Now, data sharing and by buying habits and what Amazon is
1546 sending me through emails or pop-ups that, because they watch my
1547 buying habits and they're recommending certain things, that
1548 benefits me. I get all that.

1549 But I can tell you the constituents in the 3rd District of
1550 South Carolina are concerned about who has that information, what
1551 they're doing with it and ultimately does it get in the
1552 government's hands without any sort of 4th Amendment protection,
1553 so to speak.

1554 So I would just love to -- I know, Mr. Poonen, you were talking
1555 about some of that earlier. I would just like to expound on that.
1556 Who owns that data and how can I assure my constituents that that
1557 data is not going to be used wrongly.

1558 And then I would also like to get back out on that tangent
1559 because you have got proprietary information and corporations,
1560 and we all know that China got the plans for the F-35.

1561 China has gotten plans for a lot of the military components
1562 with the best safeguards of cybersecurity in place by our
1563 government, right, who has access to all of you all to create those
1564 platforms for security.

1565 So I would like to talk about not only individual privacy

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

This is a preliminary, unedited transcript. The statements within⁸¹ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1566 and data ownership but also how do we keep China from -- or a
1567 Chinese company, and I am not just singling China out but from
1568 going to BMW or Magna or some sort of manufacturer in the 3rd
1569 District and getting proprietary information as well and creating
1570 a competing product.

1571 Mr. Poonen. Yes. Very briefly, and then allow time for my
1572 other colleagues, too.

1573 This is a very hard topic. I would be smug if I said we have
1574 all the answers today. This is going to require continued
1575 innovation and collaboration with the government.

1576 I would say there's a family of problems that are related
1577 to predictive maintenance of machines that are positive.

1578 For example, if the refrigerator or the washing machine is
1579 about to, you know, kind of, you know, decrepit and you need
1580 someone to come and help you in that, that's a family of problems
1581 -- that people are probably less concerned. The data on that
1582 machine probably needs to be encrypted.

1583 But as soon as you have things that are voice recognition,
1584 camera related, privacy concerns, and we encourage consumers,
1585 certainly enterprises also, to be extremely cautious.

1586 You can turn the camera off on your TV. You can certainly

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.

1587 unplug Alexa when you need to and get appropriate cautions on how
1588 you handle these consumer devices.

1589 Mr. Duncan. But that smart TV is monitoring all of your
1590 viewing habits.

1591 Mr. Poonen. Exactly. So this is going to be one of those
1592 places where a combination of encryption, a combination of
1593 technologies, and I am with you. Consumer privacy -- the consumer
1594 owns that data. The way in which they interact with enterprises
1595 -- most of our focus has been on the enterprise use of this. But
1596 the consumer part of it is a huge problem that needs to be solved
1597 together and there's no easy answer for much of this because we
1598 are just beginning to scratch the surface of many of the topics
1599 that are way out there.

1600 Mr. Duncan. In the essence of time, we know China took the
1601 plans for the F-35, so to speak, and government was involved. How
1602 do private industry -- how can they have some assurance that their
1603 proprietary information is sheltered from their competitors?

1604 Mr. Poonen. We are seeing the shift from assuming that we
1605 can prevent an enemy, if you will, from getting in to being able
1606 to detect that as quickly as possible.

1607 So if you think about what is your mitigation plan if you

This is a preliminary, unedited transcript. The statements within⁸³ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1608 assume a thesis of you'll prevent attack from occurring, you have
1609 a very different outcome in that strategy and that plan that if
1610 you assume that you will not be able to prevent an attack and so
1611 now your strategy is going to be to detect that as quickly as
1612 possible, to shut down that intrusion, and then to take the
1613 corrective actions from that point forward but detecting that as
1614 soon as possible.

1615 So going from protecting to detecting and then taking a
1616 counter measure as quickly as possible in every sense of that word
1617 I think is a shift we are seeing right now. It's no longer, as
1618 you pointed out, the best resources on the planet in some instances
1619 cannot protect that attack from occurring. So let's focus more
1620 on leveraging all the technologies spoken about here -- machine
1621 learning, artificial intelligence, technologies like deep packet
1622 inspection, over packets on the network, to be able to detect that
1623 if that is occurring.

1624 With regard to in-home, I think similarly we are going to
1625 see -- technology has been used for a while in the network space
1626 called deep packet inspection where why not have a single source
1627 of truth of the information that's leaving my home.

1628 So what products are sharing what information with whom, and

This is a preliminary, unedited transcript. The statements within⁸⁴ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1629 imagine if I had a dashboard that I could go to a portal on a web
1630 page in my home and I could see, well, I shut that TV -- I don't
1631 what that camera on that TV sharing information. Is in fact that
1632 data going out over my network or not, and those kind of dashboards
1633 so that we can have -- enjoy, all of us, the convenience associated
1634 with sharing the information but have the integrity and single
1635 source of truth to understand what actually is being shared, and
1636 I, you know, agree with the number of devices and the prolific
1637 nature of this that thinking that we are going to be able to control
1638 that because we were told it works a certain way is not going to
1639 be sufficient.

1640 Mr. Duncan. I guess my constituents would say, is Big
1641 Brother going to call me or send me a notice and say that your
1642 thermostat was set on 72 when you left the house today and you
1643 have over utilized your allotment of electricity for the day. Do
1644 you see what I am saying?

1645 Mr. Poonen. I do.

1646 [Simultaneous speaking.]

1647 Mr. Duncan. -- - be going and that's a true concern.

1648 Mr. Poonen. I think the best answer to that is to use all
1649 the mechanisms I just mentioned and more to come to ensure that

NEAL R. GROSS

This is a preliminary, unedited transcript. The statements within⁸⁵ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1650 that's your option -- that you're informed enough to -- it's your
1651 choice to share that information for a benefit gained.

1652 Mr. Duncan. I am way over time, Mr. Chairman. Thanks for
1653 leniency.

1654 Mr. Latta. Thank you very much.

1655 The chair now recognizes the gentleman from Texas for five
1656 minutes.

1657 Mr. Green. Thank you, Mr. Chairman. I thank our witnesses
1658 for being here.

1659 Sorry we have other committees -- the Energy Committee
1660 upstairs and so I am jumping back and forth.

1661 When I first saw the hearing, and that's why I appreciate
1662 this subcommittee -- the internet of things -- I thought, what
1663 in the devil is the internet of things. I cleaned up my speech
1664 after the president didn't.

1665 But what is it? And thank goodness I have young staff to
1666 explain to me. I am glad you're having the hearing because it
1667 makes some of us who don't typically live with these things shed
1668 light on different aspects of the smart manufacturing and the
1669 internet of things.

1670 One of our witnesses mentioned manufacturing as one of the

This is a preliminary, unedited transcript. The statements within⁸⁶ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1671 sectors that is investing the most in IOT. I have a district
1672 that's predominantly petrochemical refineries, chemical plants,
1673 extraction, and I know they're looking for every way they can using
1674 technology to both to produce their product safely or cleaner and
1675 doing more smart manufacturing can make operations both
1676 environmental safer and more efficient. But Congress needs to
1677 do more to prepare our workforce for those changing needs and
1678 manufacturers.

1679 Mr. Kurfess, you mentioned in your testimony importance of
1680 instilling a culture of lifelong learning and of helping to train
1681 our manufacturing workforce in the data science and IT skills that
1682 workers need. Some people that need job training the most are
1683 the unemployed and one of the biggest obstacles they face getting
1684 into that technical training is the cost of it.

1685 Can you elaborate on possible ways Congress can help this
1686 technical training be made more affordable as well as help support
1687 a culture of lifelong learning broadly?

1688 Mr. Kurfess. Sure. I would be very happy to do that,
1689 Congressman.

1690 You know, in terms of -- I know that there are a lot of
1691 initiatives that are really supporting the community colleges.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

This is a preliminary, unedited transcript. The statements within⁸⁷ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1692 These are the two-year colleges and so forth. They're very cost
1693 effective for the training of the workforce and so forth and
1694 there's a lot of leveraging that goes on there.

1695 We heard about some of the online courses, you know, that
1696 are available today, even via YouTube and so forth. And actually,
1697 our -- at least our younger generation they learn and they think
1698 in a different way, right.

1699 So, you know, when I was a student I might have had one book
1700 to look at or maybe two books to look at. Now they go out there
1701 and they get, you know, 10, 20, 30 different examples and so
1702 forth.

1703 So, really, not only just saying yes, you know, we could make
1704 sure that we can, you know, support the community colleges and
1705 some of the professional societies that have, you know, these
1706 types of course offering technical training offering but also the
1707 ability to basically say yeah, let's make sure that we are starting
1708 to leverage some of these new approaches to teaching and so forth
1709 and that we understand that they're out there so that it comes
1710 out there very quickly.

1711 And by the way, these are also very important not just because
1712 they're lower cost but they're very nimble. They can respond

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1713 quickly to new technology as it comes along.

1714 So, you know, if you have some YouTube videos out there --
1715 I mean, you can -- you know, you can, you know, learn anything
1716 from fixing, you know, a faucet, you know, all the way to, you
1717 know, hey, let's go do a calculus problem, right.

1718 But as new technology comes along, I mean, it's amazing,
1719 right. You can go off, go to You Tube. You can go to some of
1720 these different courses, even -- even, you know, MOOCs, these
1721 massively online courses and so forth that some institutions offer
1722 for free, right. And so how do we promote that, how do we then
1723 -- once you have that, I think the next key thing is certification.
1724 Yes, you are certified in that course. So that when they go to
1725 your company -- and by the way, it's interesting, when I think
1726 of -- people think manufacturing, make a car. Those petro
1727 chemical plants are enormous manufacturers within the United
1728 States.

1729 And so how do we know, right, when that company says yeah,
1730 I want to hire somebody that yeah, this person has the right
1731 credentials. It's great that they have a degree from, let's say,
1732 a Georgia Tech, but what about just some of the smaller credentials
1733 that are going along. So a lot of that credentialing and getting

NEAL R. GROSS

1734 back to some of the standards that we are looking at.

1735 Mr. Green. Well, I appreciate that.

1736 I actually have a community college in our area who partners
1737 with the petro chemical industry -- San Jacinto College in east
1738 Harris County, Lee College in Baytown, because of the dominance
1739 of that industry, and I've been out there and they're doing --
1740 and a number of my other community colleges in our area developing
1741 the same thing because you just don't go get your Associate's or
1742 your Bachelor's or anything. You need to continue to look at
1743 what's new, and I was there on campus one time and the -- a young
1744 man had about three different certifications, and he was getting
1745 offers of over \$150,000 at a Shell refinery or a LyondellBasell
1746 refinery or chemical plants.

1747 So it's a way that someone -- but you have to continue to
1748 keep up with your industry and that's what community colleges can
1749 do.

1750 So I appreciate -- Mr. Chairman, thank you for the time.

1751 Mr. Latta. Well, thank you very much. The gentleman yields
1752 back. The chair now recognizes the gentleman from Indiana for
1753 five minutes.

1754 Mr. Bucshon. Thank you, Mr. Chairman.

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1755 Mr. Poonen, I am going to primarily talk with you and some
1756 of the other about security. Mostly, it seems to me, when we're
1757 talking about security we are talking about software and other
1758 -- and access and things like that -- passwords and all of that.

1759 But you probably saw in the news recently that in some areas
1760 across the country there were some communities and police
1761 departments that took down their security cameras because of
1762 concerns of where that products was made, and it was made overseas
1763 and so there was some question not about that it was connected
1764 to the internet but the actual hardware itself and whether that
1765 was compromised.

1766 What are we doing -- and I know -- there's some things I know
1767 that we do at the federal government level to ensure, for example,
1768 that chips that are used in Defense Department products are not
1769 compromised, so to speak, but worldwide and even in the U.S. some
1770 people estimate as many as 10 to 15 percent of computer -- the
1771 hardware, like the silicon chips, are actually counterfeit.

1772 What -- that's an area I think we should also look at. What
1773 are we doing there?

1774 Mr. Poonen. I think it's absolutely wise, sir.

1775 I think that when you think about security it absolutely is

1776 in all of those layers. You need a multi layered, whether it's
1777 the hardware or the software, whether it was the service, was the
1778 people.

1779 And listen, capitalism works only if the entire world is a
1780 level playing field and when some countries are not necessarily
1781 playing by that I think it's absolutely the wise policy, whether
1782 it's the FBI, whether it's the appropriate agencies, to ensure
1783 that our products, whether they're bought for a foreign party,
1784 don't have embedded components, hardware or others, that could
1785 potentially compromise the security. So --

1786 Mr. Bucshon. I can tell you probably know and I know this
1787 myself, sometimes it takes an electron microscope and people that
1788 understand it to detect these problems with just -- with chips
1789 and stuff.

1790 Mr. Poonen. Yes, absolutely.

1791 Mr. Bucshon. I mean, it's pretty sophisticated.

1792 Mr. Poonen. Yes, and that -- there's absolutely that --
1793 evidence of that happening. I think the appropriate scrutiny --
1794 I am not a protectionist in terms of the way in which we think
1795 about the economy. We do believe in free market. But it has to
1796 be one with a level playing field.

1797 So many of the governments that have been focused on this,
1798 certainly in the United States and Israel, that have had this have
1799 got a very good way of looking at the ways in which many foreign
1800 governments are building technologies, and without naming certain
1801 countries, we've got to continue that diligence, because whether
1802 it's the camera technology, whether it's voice recognition, the
1803 types of things that could leave us vulnerable, we've got to make
1804 sure we've got the most protection. We fully -- we work very
1805 closely, both the industry and the government, the agencies, it
1806 ensure that happens. That's probably a topic we haven't talked
1807 about. I am very glad that this committee is focusing a lot on
1808 security. Security is probably one of the key topics in this
1809 entire topic of IOT that needs even more and more focus.

1810 Mr. Bucshon. Yes, because, you know, I mean, it is a global
1811 marketplace and I am in favor of that. I am a free market person
1812 also. I think we all are.

1813 But we also, from our jobs' perspective as members of
1814 congress we have consider national security-related risks and
1815 portals of entry into our -- that can -- you know, and the biggest
1816 portal of entry -- port of entry that we have is our -- is our
1817 people using connected devices, maybe even at their homes, right.

This is a preliminary, unedited transcript. The statements within⁹³ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1818 For example, say someone works -- I will just -- say they
1819 work at the NSA and they deal with classified material every day
1820 that we don't want people to know about. But when they go home
1821 they have all their devices at home are all connected and who knows
1822 who's listening.

1823 And, you know, and even though they're not supposed to --
1824 you know, what if they're just, you know, pontificating among even
1825 themselves about the day's activities? I mean, it's hard to know.

1826 So I have pretty significant concerns about on the hardware
1827 side, I mean, about -- because once we are able to mitigate other
1828 things, people are smart. They're going to be one step -- you're
1829 already too late when the hardware itself is compromised. Does
1830 that make any sense?

1831 Mr. Bianculli. Yeah. I am just going to add it absolutely
1832 does make sense, Congressman. If I could add -- if I could
1833 suggest, we could break the problem down to two components.

1834 One is around the counterfeit side of things. So these are
1835 counterfeit chips or, you know, that are made overseas, copying
1836 our technology, and as you pointed out, you need somebody with
1837 sophisticated technology to check that.

1838 But what I would say is that actually IOT is a mechanism for

This is a preliminary, unedited transcript. The statements within⁹⁴ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1839 auditing that because if I am -- - I mean we're seeing this occur
1840 today, if I'm a manufacturer -- a semiconductor manufacturer of
1841 those chips, I can have each one of those chips report back when
1842 they connect as a -- just a basically a heart -- a pulse to say
1843 that that device is present, and if I see that coming from more
1844 devices than I have shipped, I've got an indicator that there's
1845 an alternate end around from a supply chain perspective. Someone
1846 else is putting -- injecting, if you will, these chips into the
1847 supply chain that aren't coming from my factory.

1848 So it's sort of an IOT connected auditing mechanism. I think
1849 that represents one level of -- certainly compromises economics
1850 but is a little bit lower on the threat level compared to, as you
1851 were suggesting, information that's being sent -- that's actually
1852 being captured we don't know it -- the example you gave around
1853 the device in the home connecting back to the network or a video
1854 camera in a municipality that's sending information back to
1855 individuals that we don't want it to go to.

1856 And there, I think, we -- and we are -- a number of companies
1857 working on networking technology that can detect if information
1858 is being sent that is -- that is different than what we intended
1859 to be sent.

NEAL R. GROSS

1860 And I think if we can -- if we can audit the network, if you
1861 will, the pipe of data that's being sent to see what's actually
1862 being sent versus what we've authorized, and at the same time we
1863 can continue to invest and drive in IOT. So all of our devices,
1864 for instance, that are connected out in the field can connect back,
1865 we can literally count the devices we've shipped. We can count
1866 the devices we see. And if there's more devices we see than we've
1867 shipped then something else is going on.

1868 So those, I think, are perhaps two ways to look at it.
1869 Certainly a complicated problem, as our colleagues have pointed
1870 out. But a food for thought, perhaps.

1871 Mr. Bucshon. Okay. Thank you.

1872 I yield back, Mr. Chairman.

1873 Mr. Latta. The gentleman yields back.

1874 The gentleman from California is recognized for five
1875 minutes.

1876 Mr. Cardenas. Thank you, Chairman Latta and Ranking Member
1877 Schakowsky, for calling this hearing.

1878 As a former small business owner myself, I know that a
1879 business that is not growing and evolving is a business that is
1880 not succeeding.

This is a preliminary, unedited transcript. The statements within⁹⁶ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1881 As an engineer, I've studied the rise and proliferation of
1882 connected devices and for the potential to help businesses and
1883 government evolve and better serve their consumers and
1884 constituents.

1885 For example, a company in my district that testified last
1886 June in this hearing on the internet of things, Louroe Electronics
1887 uses connected microphones and sensors to help protect property
1888 and also help law enforcement detect and rapidly respond to
1889 gunshots.

1890 On the public service side, the internet of things technology
1891 has helped local governments and firefighters monitor and prevent
1892 and fight back firefighters in southern California, for example.

1893 Recently, the House passed my amendment to study the use of
1894 drones to detect and fight wildfires. However, I also know that
1895 as with any rapid-growing technology we must encourage innovation
1896 smartly, responsibly, and with our eyes wide open.

1897 We are constantly learning that virtually any connection can
1898 be hacked. So cyber security is an area that businesses and
1899 government will have to pay extremely close attention to and
1900 invest a lot of resources.

1901 Another issue that we need to hold our businesses to a high

This is a preliminary, unedited transcript. The statements within⁹⁷ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1902 standard on is workforce preparedness. As our companies evolve,
1903 our workforce must necessarily evolve as well.

1904 Ideally, this evolution will come in the form of education
1905 and retraining. This was an important issue that I brought up
1906 during our markup of the SELF DRIVE Act and it's an important issue
1907 in every environment.

1908 For example, southern California happens to be -- I was told
1909 when I got elected to Congress I was reminded that southern
1910 California is the largest manufacturing area in the entire
1911 country. I was pleased and surprised to hear that. So this is
1912 an issue that not only is important to my district but important
1913 to one of the biggest economies in the world, which is California.

1914 My first question is to Dr. Kurfess. You have the advantage
1915 of a bird's eye view of the industrial internet of things through
1916 your work with a variety of companies.

1917 So can you describe briefly what practices you've seen that
1918 help workers adapt to and learn how to better use new technologies?

1919 Mr. Kurfess. Sure. That's -- it's relatively
1920 straightforward. Some of the practices that are out there
1921 actually get to some of the discussions we've had about just
1922 hygiene, right. You know, don't plug your phone, you know, into

NEAL R. GROSS

1923 the million-dollar machine tool out there because it might have
1924 a virus on it and so forth. But some of the other practices really
1925 go along the lines of, you know, understanding what people are
1926 comfortable with, you know, in terms of using and so forth and
1927 letting them make use of that technology in place.

1928 As I said before, we actually have developed some software
1929 where you're doing a Pikeman type of program -- you know, you're
1930 looking for the guy to try and capture. But that guy you're trying
1931 to capture is a flaw in your production cycle and so forth and
1932 you capture it.

1933 So you actually start to bring these together. The internet
1934 of things -- people are very comfortable in general. It just
1935 doesn't matter who you are. People have the smart phones now and
1936 they're very comfortable using it.

1937 And so the idea really is yeah, can you bring that comfort
1938 together so that, you know, they make use of it in a very easy
1939 and natural way.

1940 So that's one of the things. The other thing, again, and
1941 we've heard from several companies here, again, just continuous
1942 learning, you know, to make it easy, to make -- you make it
1943 rewarded, to provide the time so that the people in the plant can

1944 do some learning.

1945 And we are not talking hours and hours of time. Typically,
1946 it's just yeah, just take a look at this thing -- you know, we
1947 can track your progress and so forth and, you know, making sure
1948 that they're up to speed on what a company needs to have them up
1949 to speed on -- whatever that might be.

1950 Today it's going to be, and again, you know, coming out of
1951 California you realize this -- whatever's going on today may not
1952 make a whole lot of difference tomorrow in terms of technology.
1953 That's how rapidly things are changing.

1954 Mr. Cardenas. It's interesting that you describe the
1955 example of the cell phone and how that could interfere with the
1956 opportunity to, unfortunately, have an infiltration in your
1957 system.

1958 I learned, again, through this committee is -- one of the
1959 subcommittees on health, is that some hospitals, and a lot of
1960 people now realize that infections -- if you're going to get an
1961 infection, probably going to get it a hospital more than anywhere
1962 else -- that it wasn't some incredibly expensive process to bring
1963 down the infection rate I hospitals other than having the
1964 discipline of everybody washing their hands at every opportunity.

1965 Something as simple as soap.

1966 But what I am getting at is I think it's important for us
1967 to teach the next generation of workforce that even though they
1968 find these things to be so darn convenient and think that it's
1969 the answer to everything. It actually, if not handled properly,
1970 with simple measures you could actually cause a disaster or
1971 catastrophe that is unintended.

1972 So I think it's important for us to realize that sometimes
1973 the answers are complicated. Sometimes the answers are really
1974 simple about basic discipline.

1975 Thank you very much, and I yield back my time.

1976 Mr. Latta. Thank you very much. The gentleman yields back.
1977 The chair now recognizes the gentleman from Florida for five
1978 minutes.

1979 Mr. Bilirakis. Thank you, Mr. Chairman. I appreciate it,
1980 and thanks for the testimony.

1981 I was at the VA Committee -- the joint VA Committee hearing.
1982 So I apologize for being late.

1983 I have a couple questions. The first one for Mr. Bianculli
1984 -- in your testimony you state that industrial IOT-based solutions
1985 are allowing companies to create jobs. One of the big concerns

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

This is a preliminary, unedited transcript. The statements within¹⁰¹ may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1986 we are facing is automation replacing jobs. So can you please
1987 explain to us how these solutions help create jobs?

1988 Mr. Bianculli. Sure. Yeah, I think there's sort of a micro
1989 and a macro view on that. The micro one I mentioned a little bit
1990 earlier around machines working with workers to help them get
1991 their jobs done more effectively.

1992 And I think when we think about that, we have a tendency to
1993 think of the brawn side of that, meaning that the physical movement
1994 of goods and that's for sure a part of it.

1995 The other part of it is that the brain or the intelligence
1996 are an assistant that can work along the worker. So we mentioned
1997 wearable technology, augmented reality, being able to put
1998 information right up in front of the user.

1999 And as this starts to assist you, that should create more
2000 job satisfaction, a better work environment. It also, in
2001 addition to increasing quality and having benefit to the bottom
2002 line, it reduces the cost of getting that job done.

2003 And so if I shift from the micro perspective over to macro,
2004 as we reduce the cost of getting that job done, we become more
2005 competitive on a global basis, thereby bringing jobs back in.

2006 So if we look at any one instance we could point to well,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

2007 if we are reducing the cost of labor that -- some might say that's
2008 reducing the number of jobs. I would say it's increasing the
2009 efficiency of an individual and thereby increasing efficiency of
2010 that individual has the macro effect of making us more competitive
2011 on a global stage.

2012 And I think that we are starting -- I mean, it's happening
2013 already. We are starting to see that bear itself out. The other
2014 thing we are starting to see with the on-demand economy that we
2015 mentioned earlier is the peaks are getting peakier, if you will.

2016 If you look at the number of shipments that are happening
2017 from manufacturing facilities or from fulfillment centers in the
2018 November to January time frame -- in some cases, you know, you
2019 see this in the headlines -- transportation carriers, retailers,
2020 are doubling or tripling their workforce to be able to handle that
2021 peak demand.

2022 And so when you bring that influx of workers in, if it takes
2023 two week to train somebody how to do that job, you're a third of
2024 the way through that peak cycle.

2025 So leveraging this technology so that someone can be
2026 functional and up and running in an hour and be as skilled or as
2027 capable as someone that's been doing it for several weeks also

This is a preliminary, unedited transcript. The statements within^{1:03} may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

2028 becomes very important.

2029 So I think if we view it that way and look at the bigger
2030 picture over the longer time horizon, there's early indicators
2031 that what I just described is starting to happen and I think we
2032 should lean in and accelerate to take advantage of that for the
2033 country. Thanks.

2034 Mr. Bilirakis. Thank you. Good answer.

2035 In your testimony, Mr. Masney, you note that, and I quote,
2036 "the cost to achieve a full deployment of IOT throughout an
2037 enterprise can be quite daunting," and suggest that lowering cost
2038 -- those costs would help ensure the deployment of the IOT.

2039 What are some of the ways policy changes could help?

2040 Mr. Masney. Certainly. Looking at ways to reduce the cost
2041 per unit of a sensor or technology can help spur investment into
2042 the -- into IOT, and it's not just one thing. It's sensors. It's
2043 PLCs. It's storage. It's systems. It's investment in
2044 programming and those kinds of things.

2045 So, certainly, looking at ways that we can spur innovation,
2046 get products produced at a lower price than manufacturing
2047 companies can consume and deploy at a lower cost point, especially
2048 in a business like ours which is very capital intensive, is going
